SOCE Anchor Rubrics v0.1

Boundary descriptors, activation questions and obedience typology

Luis Bourguet · LabOnt — Centre for Ontology, Università degli Studi di Torino

v0.1.0 · July 2026

Purpose

Every value in a signature must have a criterion verifiable in text: not an abstract definition but a question answered yes/no against observable evidence. Arbitrariness is reduced by triangulation with the already-diagnosed corpus (the Anchor Set) — never by forced quantification. The accumulation mechanism is interpretive jurisprudence (validated precedents), not weight retraining.

1 · Todorov axes — procedure

For each axis the analyst applies the activation questions in ascending order, with cited evidence, and proposes **the highest value with an affirmative answer sustained in at least two independent sources**.

Dissociation rule. The analyst must not assume correlation between axes. px can be low while ax is high (the elite-Other case); ep can reach 5★ while px stays moderate. Dissociation is diagnostic — it is information, not noise.

1.1 Praxeological axis px — the thermometer (full rubric)

px	Boundary descriptor	Activation question
1	Assimilation: the Other can become Us	Is there an institutional path to full rights through integration?
2	Soft segregation: separated but tolerated	Is there systematic separation without expulsion or elimination?
3	Expulsion or physical/legal confinement	Is there deportation, internment, or active de-inscription?
4	Systematic violence with structural impunity	Is physical violence institutionalised, not episodic?
5	Physical elimination of the group as such	Is there an elimination policy with planning or mass outcome?

Corpus finding: the economic limit brakes px below 5 — where the Other retains functional utility, treatment stops short of elimination (τ_2 family).

1.2 Axiological (ax) and epistemological (ep) axes — endpoint anchors

The canon fixes verified endpoint anchors for ax and ep; intermediate values are read from the case diagnosis against Anchor Set precedents, per the governing rule (*if it cannot be read from an existing diagnosis, it does not enter the notation*):

Axis	1	5
ax	The Other valued as equal	The Other as existential threat
ep	The Other known through its own voice	**5★** — erasure of the Other's own knowledge

The **5★** marker names the level at which resistance takes generations to rebuild, because the Other's own epistemic resources have been destroyed, not merely silenced. Full intermediate boundary descriptors for ax and ep are a declared expansion for a later codebook version; until then, coding of intermediate values must cite the Anchor Set precedent on which it leans.

2 · Node IV — the ten modes of obedience (nominal typology)

Unlike Todorov, obedience is **not** an ordinal scale but a nominal typology: several modes coexist in a case; one dominates. Detection in three steps: binary presence per mode → identification of the dominant by causal argument →

mapping of the characteristic fracture.

Dominant mode	Characteristic fracture	Paradigmatic case
1 · Interiorised	Legitimacy crisis that breaks the naturalisation	All cases
2 · Performative	Coordination of private disobedience	Apartheid, Rohingya
3 · Strategic	Cost of collaborating exceeds cost of resisting	Spain 1492, Jim Crow
5 · Without legal subject	Minimal legal recognition (Node I)	Rohingya
6 · Bureaucratic-routinised	Individual responsibility made explicit	Nazi
7 · By identitarian choice	Fracture or change of the identity	AfD/Lukreta
8 · Gradual anti-institutional	Non-capturable counterweights	MAGA
9 · Institutional fracture	Expansion of non-compliant actors	EU, MAGA
10 · Direct material dependence	Exhaustion or diversification of the resource	MORENA

Numbering reaches ten although the table lists nine rows: **mode 4 (resistant)** describes active disobedience and is catalogued apart, because it is not a mode of obedience but its negation.

Reading of the full bridge. Pegoraro & Rinella's five sources answer *why* a norm binds; the ten SOCE modes answer *how* it is obeyed and *where* that mode breaks. Each mode's fracture is the design input for intervention — the specific contribution of Node IV.

3 · Node II — A_core texture

The decisive element of the ideological anatomy is the **A_core**: the set of claims believers cannot give up without abandoning the ideology; the remaining elements exist to protect it. The core is graded by how open it is to being proven wrong — from theological (essentially unfalsifiable) to securitarian-administrative (easily checked) — with the working rule: **the easier a core is to disprove, the more external support it needs to survive**, and the more the case depends on Node III's technology of imagination (transmission II.A_core → III). A_core texture also conditions the dominant obedience mode (personalist → identitarian; theological → interiorised; bureaucratic → routinised).

4 · What the rubrics do not eliminate

Being explicit about residual arbitrariness is part of the rigour. Genuinely ambiguous readings are not forced to a value: they carry an explicit **uncertainty flag (?)** and enter the validation queue, where the human analyst audits them (see `protocol/extraction_protocol`). Ambiguity is made traceable, not eliminated.
